1. **Write a Java program to read a text file and count: • Number of lines • Number of words • Number of characters**
   Code:
   ```
   package Day10;

   import java.io.*;

   public class FileStats {
      public static void main(String[] args) throws IOException {
         BufferedReader br = new BufferedReader(new FileReader("input.txt"));
         String line;
         int lineCount = 0, wordCount = 0, charCount = 0;

         while ((line = br.readLine()) != null) {
            lineCount++;
            String[] words = line.trim().split("\\s+");
            if (!line.trim().isEmpty()) {
               wordCount += words.length;
            }
            charCount += line.length();
         }
         br.close();

         System.out.println("Lines: " + lineCount);
         System.out.println("Words: " + wordCount);
         System.out.println("Characters: " + charCount);
      }
   }
   ```

2. **. Append Data to File Write a program to: • Take user input • Append that data into an existing file without deleting previous content**
   Code:
   ```
   package Day10;

   import java.io.*;

   public class AppendToFile {
      public static void main(String[] args) throws IOException {
         BufferedReader br = new BufferedReader(new InputStreamReader(System.in));
         System.out.println("Enter text to append:");
         String userInput = br.readLine();

         FileWriter fw = new FileWriter("input.txt", true); // append mode
         BufferedWriter bw = new BufferedWriter(fw);
         bw.write(userInput);
         bw.newLine();
         bw.close();

         System.out.println("Data appended successfully!");
      }
   }
   ```

3. **. Buffered Reader Usage Write a Java program to read a file using BufferedReader and print only those lines that contain the word "Java".**

Code:

```
package Day10;

import java.io.*;

public class PrintJavaLines {
    public static void main(String[] args) throws IOException {
        BufferedReader br = new BufferedReader(new FileReader("input.txt"));
        String line;
        while ((line = br.readLine()) != null) {
            if (line.contains("Java")) {
                System.out.println(line);
            }
        }
        br.close();
    }
}
```

4. **. Count Specific Word in File Write a program to count how many times a specific word (e.g., "Java") appears in a file.**

Code:

```
package Day10;

import java.io.*;

public class CountWord {
    public static void main(String[] args) throws IOException {
        BufferedReader br = new BufferedReader(new FileReader("input.txt"));
        String line;
        int count = 0;
        String target = "Java";

        while ((line = br.readLine()) != null) {
            String[] words = line.split("\\s+");
            for (String w : words) {
                if (w.equalsIgnoreCase(target)) {
                    count++;
                }
            }
        }
        br.close();

        System.out.println("Word '" + target + "' appears " + count + " times.");
    }
}
```
