1. Find the second largest element in a List.
   Code:
```
package Day7;

import java.util.*;

public class SecondLargest {

    public static Integer findSecondLargest(List<Integer> list) {
        if (list == null || list.size() < 2) {
            throw new IllegalArgumentException("List must contain at least two elements");
        }

        Integer largest = Integer.MIN_VALUE;
        Integer secondLargest = Integer.MIN_VALUE;

        for (Integer num : list) {
            if (num > largest) {
                secondLargest = largest;
                largest = num;
            } else if (num > secondLargest && !num.equals(largest)) {
                secondLargest = num;
            }
        }
        return secondLargest;
    }

    public static void main(String[] args) {
        List<Integer> numbers = Arrays.asList(10, 20, 4, 45, 99, 99);
        System.out.println("Second Largest: " + findSecondLargest(numbers));
    }
}
```
2. Find intersection of two HashSet.
   Code:
```
package Day7;

import java.util.*;

public class CommonElements {

    public static Set<Integer> findIntersection(Set<Integer> set1, Set<Integer> set2) {
        Set<Integer> intersection = new HashSet<>(set1);
        intersection.retainAll(set2);
        return intersection;
    }

    public static void main(String[] args) {
        Set<Integer> setA = new HashSet<>(Arrays.asList(1, 2, 3, 4, 5));
        Set<Integer> setB = new HashSet<>(Arrays.asList(3, 4, 5, 6, 7));

        System.out.println("Intersection: " + findIntersection(setA, setB));
    }
}
```

3. Find elements present in either of the sets but not both.

Code:

```
package Day7;

import java.util.*;

public class SymmetricDifference {

    public static Set<Integer> findSymmetricDifference(Set<Integer> set1, Set<Integer> set2) {
        Set<Integer> union = new HashSet<>(set1);
        union.addAll(set2);

        Set<Integer> intersection = new HashSet<>(set1);
        intersection.retainAll(set2);

        union.removeAll(intersection);
        return union;
    }

    public static void main(String[] args) {
        Set<Integer> setA = new HashSet<>(Arrays.asList(1, 2, 3, 4, 5));
        Set<Integer> setB = new HashSet<>(Arrays.asList(3, 4, 5, 6, 7));

        System.out.println("Symmetric Difference: " + findSymmetricDifference(setA, setB));
    }
}
```
