1. Create a package com.math.operations and write a class to perform addition and subtraction.
   Code:
```
package com.math.operations;

public class AdditionSubtraction {
   public int add(int a, int b) {
      return a + b;
   }

   public int subtract(int a, int b) {
      return a - b;
   }

   public static void main(String[] args) {
      AdditionSubtraction obj = new AdditionSubtraction();
      System.out.println("Sum: " + obj.add(10, 5));
      System.out.println("Difference: " + obj.subtract(10, 5));
   }
}
```
2. Create an abstract class Bank with method getInterestRate() and implement it in different bank classes.
   Code:
```
package Day5.bank;

public abstract class Bank {
   public abstract double getInterestRate();
}
```

File2:
```
package Day5.bank;

public class SBI extends Bank {
   @Override
   public double getInterestRate() {
      return 6.5;
   }
}
```

File3:
```
package Day5.bank;

public class ICICI extends Bank {
   @Override
   public double getInterestRate() {
      return 7.0;
   }
}
```

File4:
```
package Day5.bank;

public class BankTest {
   public static void main(String[] args) {
      Bank sbi = new SBI();
```

```
        Bank icici = new ICICI();

        System.out.println("SBI Interest Rate: " + sbi.getInterestRate() + "%");
        System.out.println("ICICI Interest Rate: " + icici.getInterestRate() + "%");
    }
}
```

3. Write a program where an interface is implemented and exception handling is used inside the method.

Code:

```
package Day5.interfaceexample;

public interface Calculator {
    int divide(int a, int b) throws ArithmeticException;
}
```

File2:

```
package Day5.interfaceexample;

public class SafeCalculator implements Calculator {
    @Override
    public int divide(int a, int b) throws ArithmeticException {
        if (b == 0) {
            throw new ArithmeticException("Division by zero is not allowed!");
        }
        return a / b;
    }
}
```

File3:

```
package Day5.interfaceexample;

public class CalculatorTest {
    public static void main(String[] args) {
        Calculator calc = new SafeCalculator();
        try {
            System.out.println("Result: " + calc.divide(10, 0));
        } catch (ArithmeticException e) {
            System.out.println("Exception caught: " + e.getMessage());
        }
    }
}
```
